

Worksheet 7: Functions Practice

1. Create two divs (having different ids) with the following text:

2. Once a user clicks on one of the divs, the div's background colour should change:

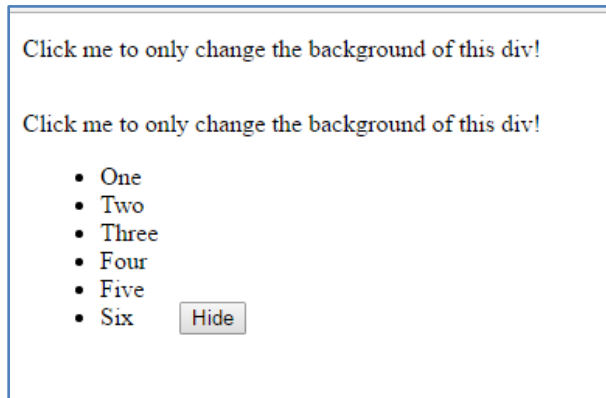

Even though, you have two different divs, you only need to create one function for the process to occur.

3. Edit the previous function, you created, so that if the current div background colour is red, then it should change the background colour to a different colour:

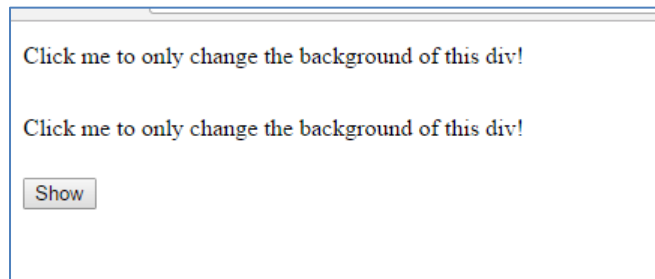

4. Create the following list and button:

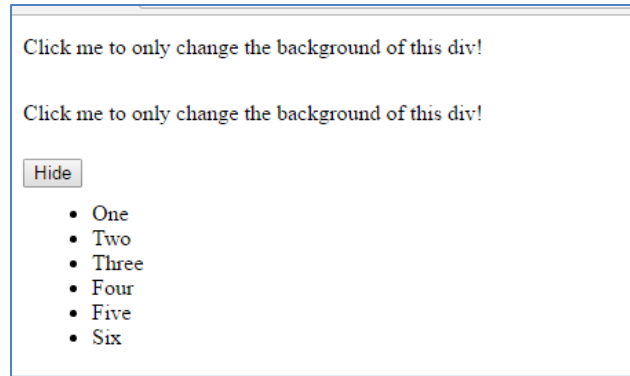

a) Once the user clicks on the *Hide* button, the list should disappear:

5. Change the above code so that the list is not shown once the page is loaded and the button text is *Show* and not *Hide*.

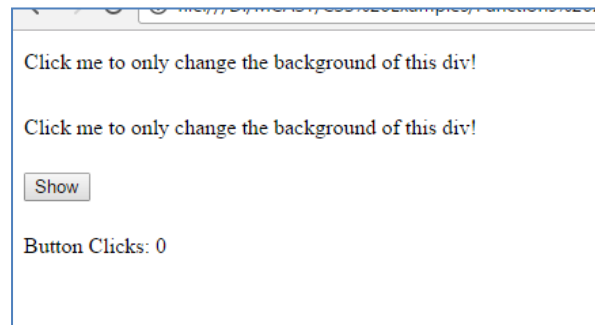

a) Once the user clicks on the *Show* button, the list should be displayed. Moreover the button text should be changed to *Hide*.

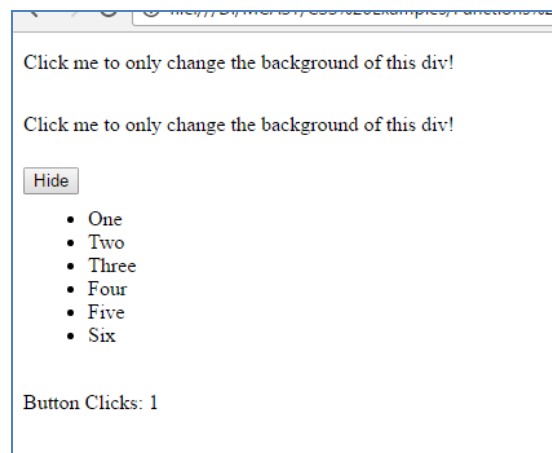

b) Once the user clicks on the *Hide* button the list should be hidden once again.

6. Change the above page to include the following:

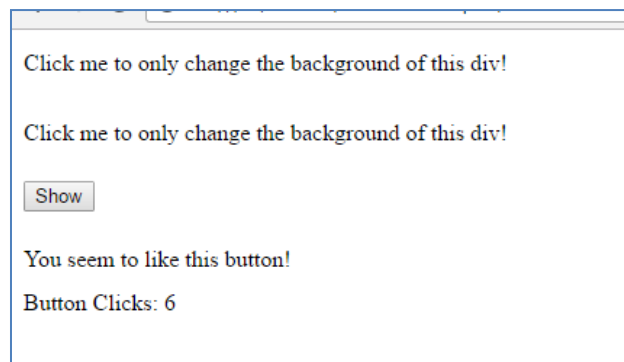

a) Upon loading the page, the amount of button clicks should be 0.

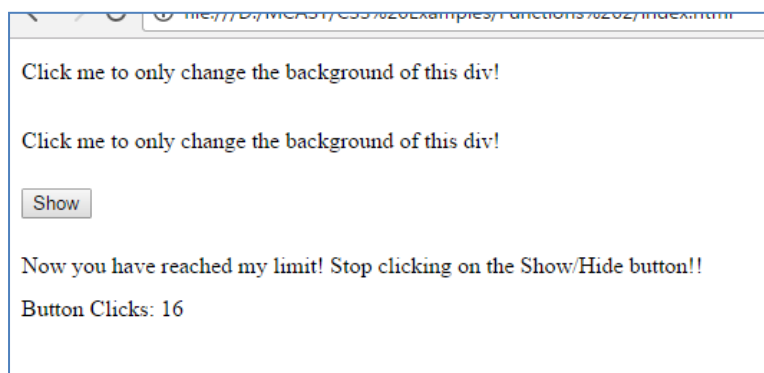

b) Everytime the user clicks on the *Show/Hide* button, the button clicks number should increment:

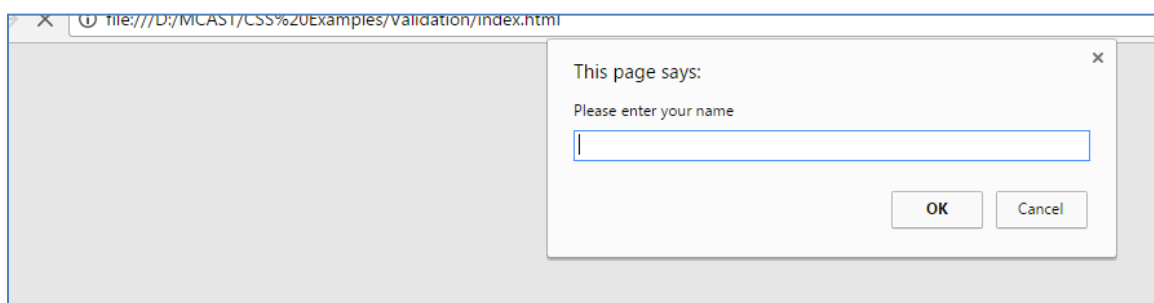

- c) When the button clicks number becomes larger than 5, a different statement should be displayed:

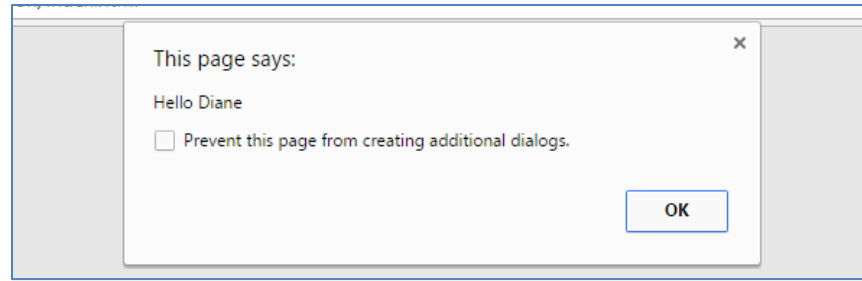

- d) When the button clicks number becomes larger than 15, a different statement should be displayed:

7. Create a new page which upon loading, asks the use to enter his/her name:

- a) If the user, did in fact enter a name, the page should greet the user accordingly:

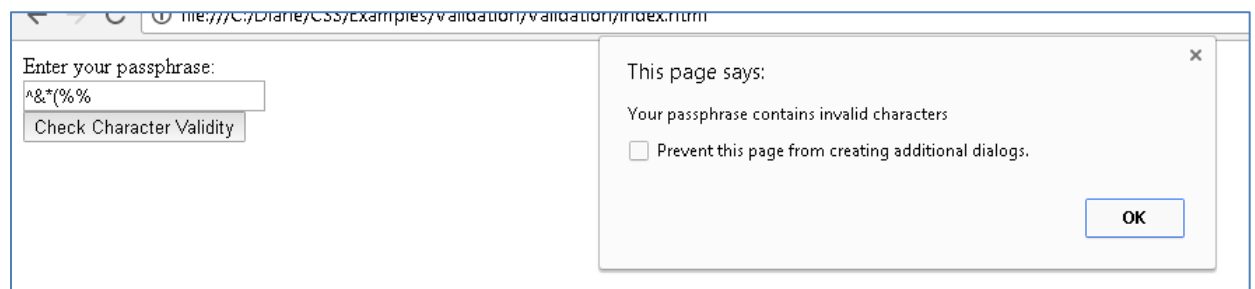

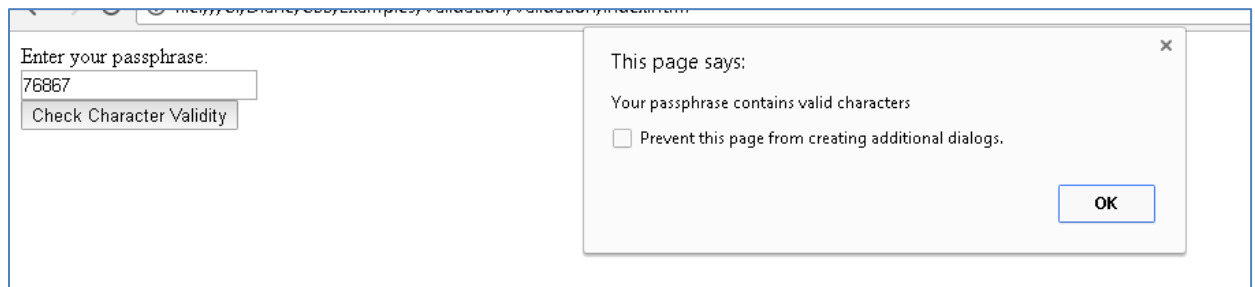

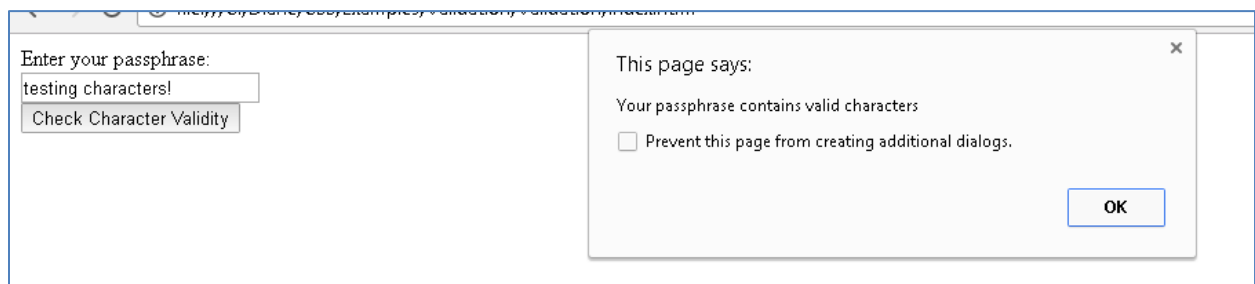

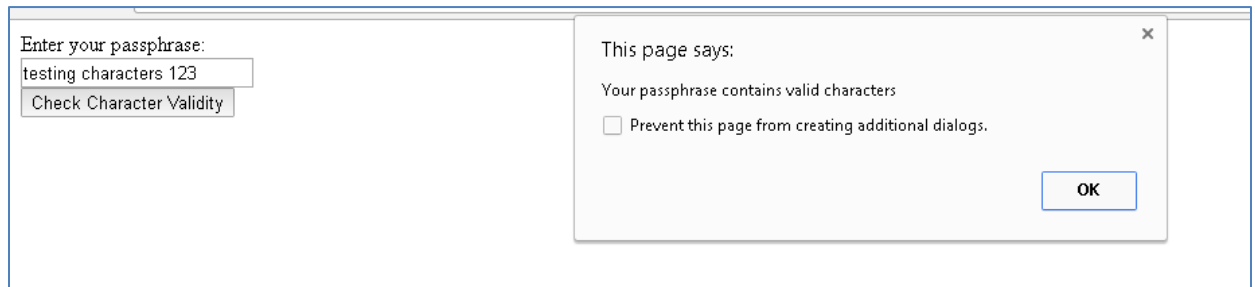

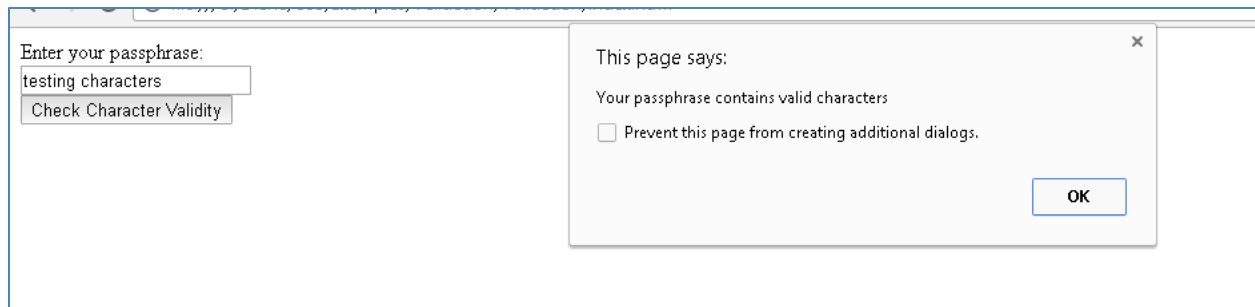

- b) Otherwise, a greeting should still be made. The name should be replaced with some other text:

8. In this same page, create the following:

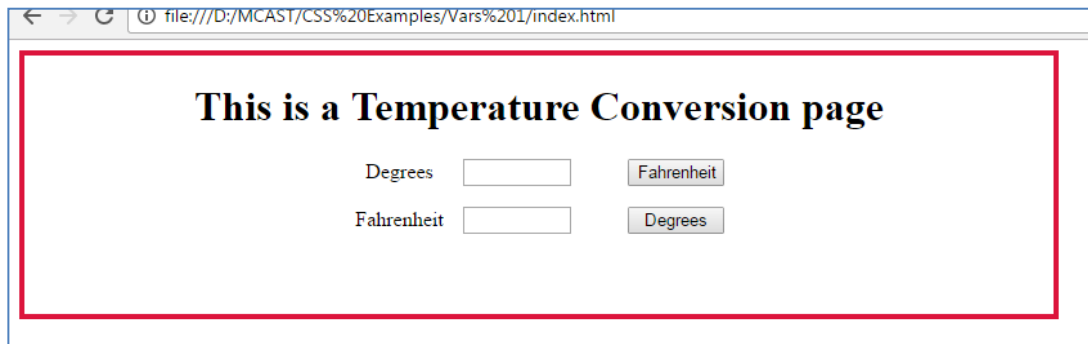

- a) The button should check the passphrase inserted to see if it contains any correct characters or not.
Characters are considered to be correct if they are alphabetical characters and/or digits.

HINT: You can use regular expressions in order to check this character validity. It is ideal that you research on regular expressions and try it out.

The last image does *not* contain any valid characters (alphabetical and/or numbers)

9. Change the Temperature Conversion page:

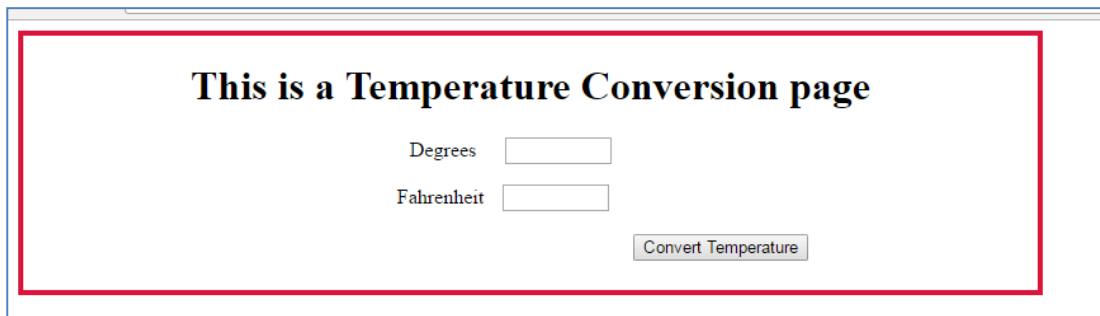

file:///D:/MCAST/CSS%20Examples/Vars%201/index.html

This is a Temperature Conversion page

Degrees Fahrenheit

Fahrenheit Degrees

To the following:

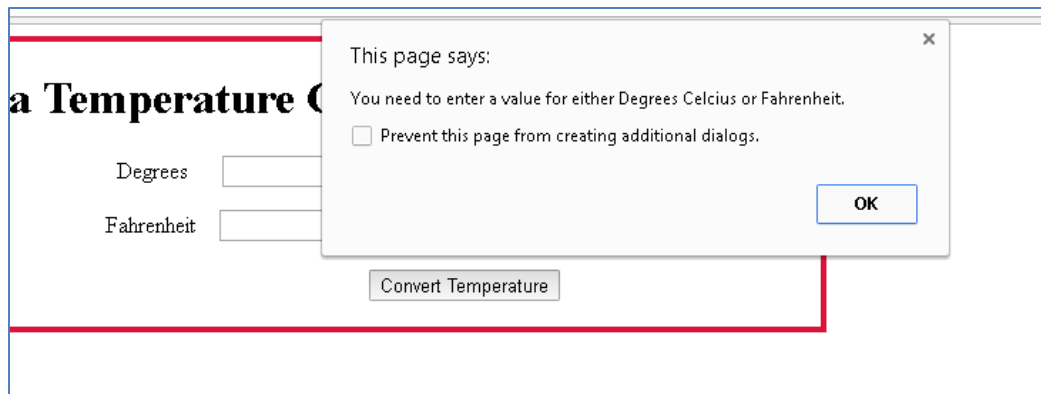

This is a Temperature Conversion page

Degrees

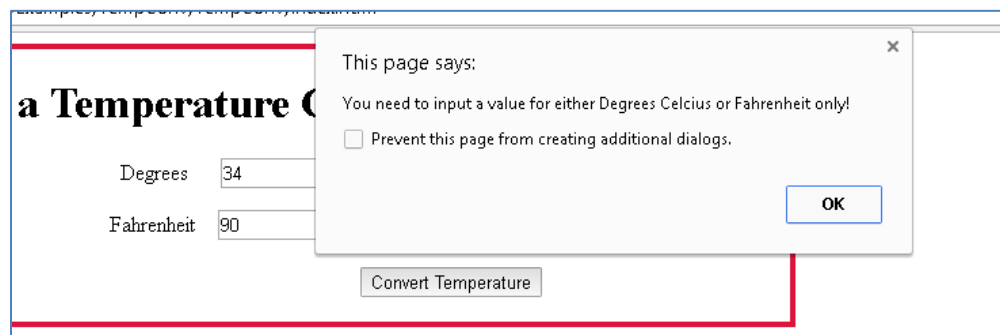

Fahrenheit

Convert Temperature

- a) The user is now required to Choose and enter a value in one of the text boxes (either for Degrees Celcius or for Fahrenheit).
- b) When the user clicks on the *Convert Temperature* button, the conversion is done depending on where the temperature was inserted:
 - i. If the user inserted the value in the *Degrees* text box, then the conversion is done from Degrees Celcius to Fahrenheit. The conversion result is shown in the *Fahrenheit* text box.
 - ii. If the user inserted the value in the *Fahrenheit* text box, then the conversion is done from Fahrenheit to Degrees Celcius. The conversion result is shown in the *Degrees* text box.
- c) If the user doesn't enter any value, an error is displayed:

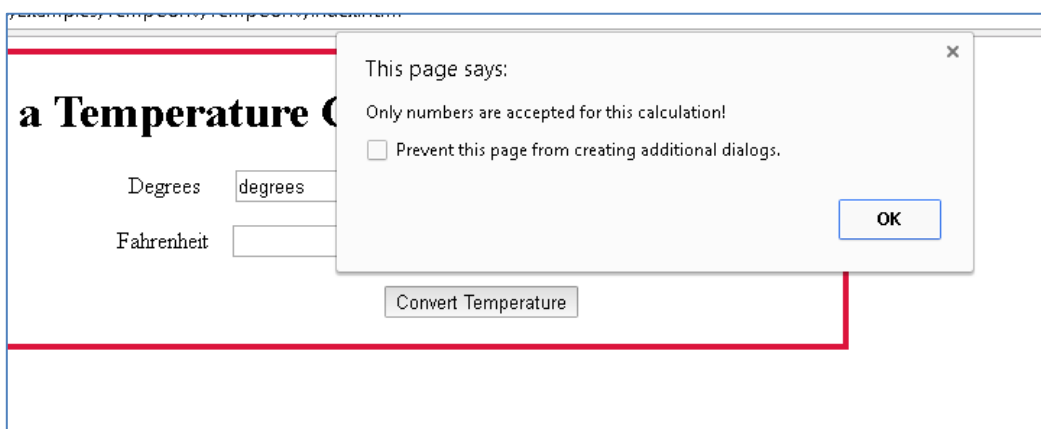

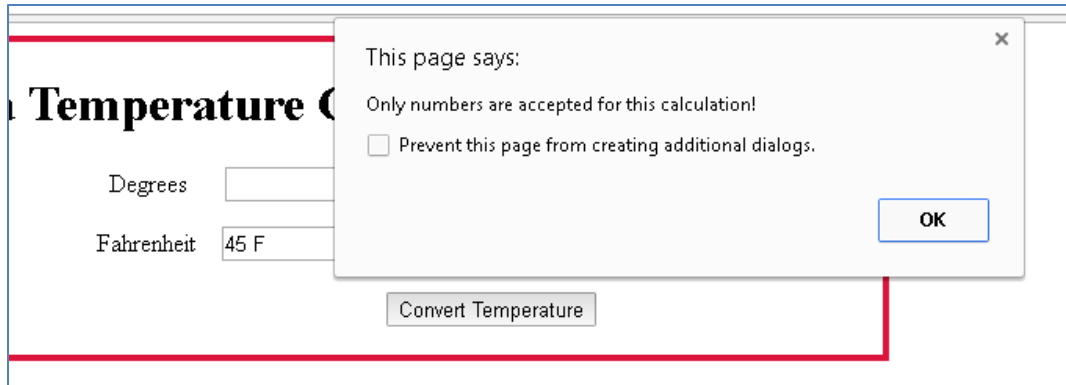

d) If the user enters two values in the two different text boxes, an error is displayed:

e) If the previous case occurs, the text boxes need to be cleared after the message box is closed.

f) If the user enters a string value, an error message should be displayed:

- g) If the previous case occurs, the value should also be cleared after the message box is closed.
